What is openEHR?

- **Set of specifications** for an **EHR architecture**:
 - Highly stable reference model for health computing platform
 - Clinical content specification:
 - General purpose **archetypes**
 - Specific purpose **templates**
 - Approach - EHR \neq all about data; IT IS NOT AN APPLICATION
- **Open source** software implementations
- Registered online community –
 - >1000 members from 75 countries
 - Technical
 - Clinical
 - Implementation

© Ocean Informatics 2008

openEHR.org

Who is openEHR?

3

- The *openEHR* Foundation is a **not-for-profit** company
- Founding members :
 - University College London (CHIME), UK and
 - Ocean Informatics, Australia.
- >15 years of research and international implementations
- Ongoing development and enhancement
- www.openEHR.org

Types of interoperability

Level 1: Non-electronic data.

Examples include paper, mail, and phone call.

Level 2: Machine transportable data.

Examples include fax, email, and unindexed documents.

Level 3: Machine organisable data

ie structured messages, unstructured content

Examples include indexed (labeled) documents, images, and objects.

Level 4: Machine interpretable data

(structured messages, **standardised content**)

Examples include the automated transfer from an external lab of coded results into a provider's EHR. Data can be transmitted (or accessed without transmission) by HIT systems without need for further semantic interpretation or translation.

Walker et al, 2005

openEHR.org

What is openEHR for? SEMANTIC INTEROPERABILITY → Shared EHRs

= specification for secure, shareable health information

Designed for:

- robust clinical record keeping;
- clinical business processes;
- medico-legal compliance; and
- supports distributed workflow

openEHR.org

Purpose-built EHR specification

COMPLEX RECORD; LEGAL

- *Management of dynamic content
- Distributed versioning/merging of records
- Audit trails
- Strong history and event model
- State model
- Archetype-driven semantic querying
- Configurable security

Traditional Application Development

Clinical Knowledge

Data Model

Nature of Health Domain

Huge amount of information

- SNOMED medical termset → 357,000 concepts and >1 million relationships

Dynamic

- Rate of change is high;
- Common knowledge today is 'out-of-date' tomorrow

Open-ended & evolving

- *In breadth* – new information discovered, or re-evaluated
- *In depth* - finer-grained detail
- *In complexity* - new relationships

Information complexity: timing

Dose frequency	Examples
every time period	...every 4 hours
n times per time period	...three times per day
n per time period	...2 per day ...6 per week
every time period range	...every 4-6 hours, ...2-3 times per day
Maximum interval	...not less than every 8 hours
Maximum per time period	...to a maximum of 4 times per day

Information complexity: timing

Time specific	Examples
Morning and/or lunch and/or evening	...take after breakfast and lunch
Specific times of day	06:00, 12:00, 20:00
Dose duration	
Time period	...via a syringe driver over 4 hours

Information complexity: timing

Event related	Examples
After/Before event	...after meals ...before lying down ...after each loose stool ...after each nappy change
n time period before/after event	...3 days before travel
Duration n time period before/after event	...on days 5-10 after menstruation begins

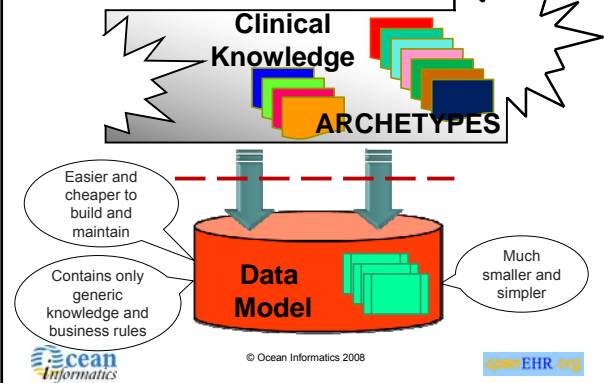

Information complexity: timing

Treatment duration	Examples
Date/time to date/time	1-7 January 2005
Now and then repeat after n time period/s	...stat, repeat in 14 days
n time period/s	...for 5 days
n doses	...Take every 2 hours for 5 doses

Information complexity: timing

Triggers/Outcomes	Examples
If condition is true	...if pulse is greater than 80 ...until bleeding stops
Start event	...Start 3 days before travel
Finish event	...Apply daily until day 21 of menstrual cycle

NEW: 2 level modelling

Archetypes

- Dictionary definition - a model or prototype
 - **openEHR archetypes are models of clinical concepts**
- = Keystone of *openEHR* architecture
- Model a range of concepts:
 - Simple and straightforward concepts
 - 'blood pressure'
 - 'weight'
 - Complex compound concepts such as
 - 'medication order'
 - 'family history'

Archetypes put the clinician in the driver's seat!

Archetypes 2

Can be standalone – one person/one purpose
BUT

Archetypes are most useful when

- **Shared**
 - **Re-used**
- } Central Archetype Repository
– revisions; versions; release sets

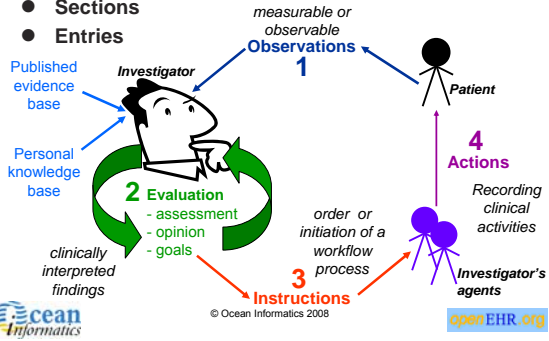

Potential for a
SINGLE, SEMANTIC MODEL
of clinical content

Single Semantic Model

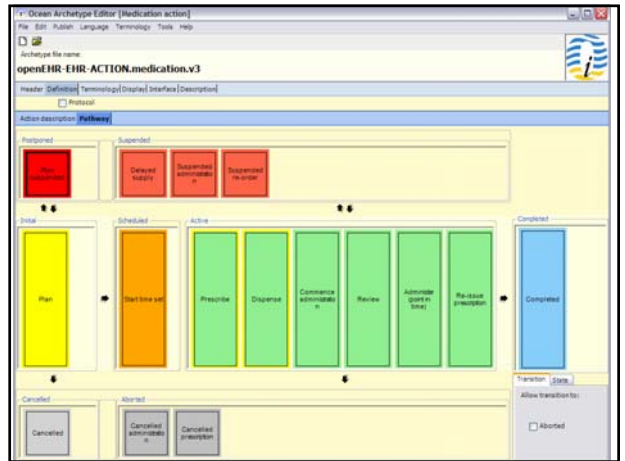

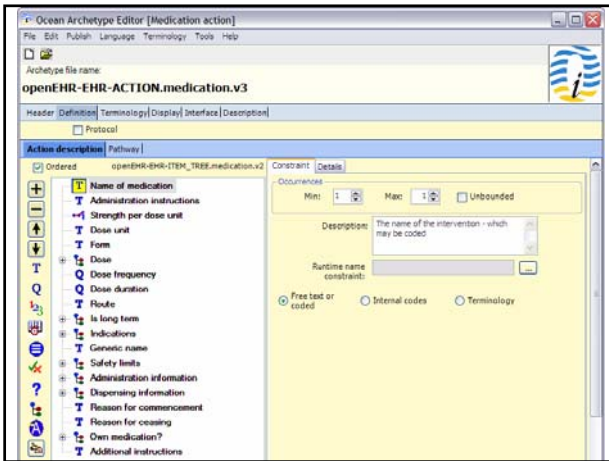

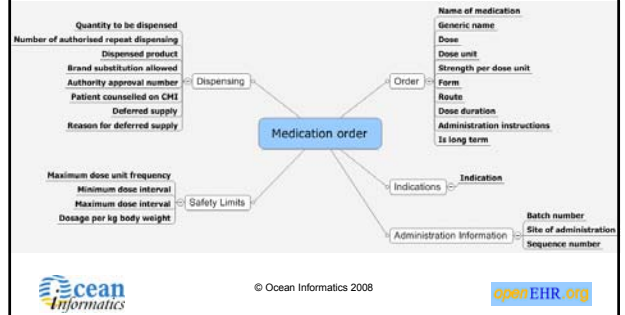

Types of Archetypes

- Compositions
- Sections
- Entries

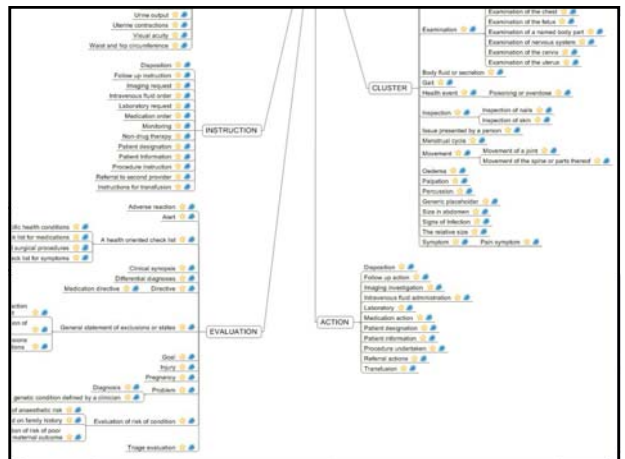

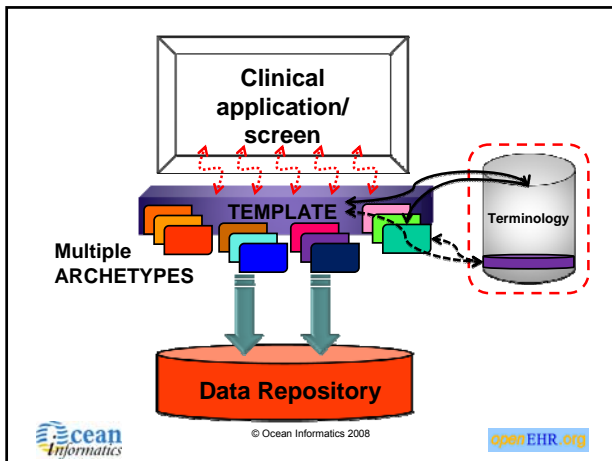

Designing an archetype

Clinician involvement required → Maximum Data Set

Action State Model

Multilingual Archetypes

Each archetype is translated once
No language of primacy

≡ English	≡ Portuguese
≡ Japanese?	≡ Danish
≡ German	≡ Swedish
≡ Dutch	≡ Turkish
≡ Spanish	≡ Farsi

Longitudinal Health Records

LIFELONG

~~2000~~.....

The diagram shows two systems, 'System D' and 'System E', connected to a 'Shared EHR Repository' (represented by a red cylinder). A callout bubble says 'Easier and cheaper to build and maintain'. Another callout says 'Contains only generic knowledge and business rules'. A third callout says 'Much smaller and simpler'. The Ocean Informatics logo and '© Ocean Informatics 2008' are at the bottom left, and 'openEHR.org' is at the bottom right.

Model governance

REPOSITORY

- Manage Archetype and Template lifecycle
 - Creation → Clinical Review → Publication
- Version management
- Terminology subsets
- Release sets
- Community engagement

The Ocean Informatics logo and '© Ocean Informatics 2008' are at the bottom left, and 'openEHR.org' is at the bottom right.
